# Table of contents

- 1 Introduction
  - Problem setting
  - Some classical examples for pointwise multipliers
- 2 Pointwise multipliers in function spaces
  - Resolution of unity
  - The definition of function spaces on  $\mathbb{R}^n$
  - Atomic characterizations of function spaces
  - A simple approach to pointwise multipliers in function spaces
- 3 Diffeomorphisms in function spaces
  - A theorem on diffeomorphisms in function spaces

# The problem setting

We want to observe the behaviour of the linear mappings

$$P_\varphi : f \mapsto \varphi \cdot f$$

# The problem setting

We want to observe the behaviour of the linear mappings

$$P_\varphi : f \mapsto \varphi \cdot f$$

and

$$D_\varphi : f \mapsto f \circ \varphi,$$

where  $f$  is an element of a function space (Besov, Triebel-Lizorkin type) and  $\varphi$  is a suitably smooth function.

# The problem setting

We want to observe the behaviour of the linear mappings

$$P_\varphi : f \mapsto \varphi \cdot f$$

and

$$D_\varphi : f \mapsto f \circ \varphi,$$

where  $f$  is an element of a function space (Besov, Triebel-Lizorkin type) and  $\varphi$  is a suitably smooth function.

The aim:

If  $\varphi$  fulfils . . . , then  $P_\varphi$  resp.  $D_\varphi$  maps the function space  $A$  into  $A$ .

# The spaces $C^k$

Let  $C^k$  be the space of all  $k$ -times differentiable functions  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  such that

$$\|f\|_{C^k} := \sum_{|\alpha| \leq k} \sup |D^\alpha f(x)| < \infty.$$

# The spaces $C^k$

Let  $C^k$  be the space of all  $k$ -times differentiable functions  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  such that

$$\|f\|_{C^k} := \sum_{|\alpha| \leq k} \sup |D^\alpha f(x)| < \infty.$$

Then

$$f, g \in C^k \Rightarrow f \cdot g \in C^k \text{ and } \|f \cdot g\|_{C^k} \leq c_k \|f\|_{C^k} \cdot \|g\|_{C^k}$$

and

$$(\forall f \in C^k : f \cdot g \in C^k) \Rightarrow g \in C^k \text{ and } \|P_g : C^k \rightarrow C^k\| \geq \|g\|_{C^k}.$$

Proof: Leibniz rule and  $1 \in C^k$ .

# The Hölder spaces $\mathcal{C}^k$

Let  $0 < \sigma \leq 1$  and  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  be continuous. We define

$$\|f|lip^\sigma\| := \sup_{x,y \in \mathbb{R}^n, x \neq y} \frac{|f(x) - f(y)|}{|x - y|^\sigma},$$

Let  $s > 0$  and  $s = \lfloor s \rfloor + \{s\}$  with  $\lfloor s \rfloor \in \mathbb{Z}$  and  $\{s\} \in (0, 1]$ . Then the Hölder space with index  $s$  is given by

$$\mathcal{C}^s = \left\{ f \in C^{\lfloor s \rfloor} : \|f|C^s\| := \|f|C^{\lfloor s \rfloor}\| + \sum_{|\alpha|=\lfloor s \rfloor} \|D^\alpha f|lip^{\{s\}}\| < \infty \right\}.$$

# The Hölder spaces $\mathcal{C}^k$

Let  $0 < \sigma \leq 1$  and  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  be continuous. We define

$$\|f|lip^\sigma\| := \sup_{x,y \in \mathbb{R}^n, x \neq y} \frac{|f(x) - f(y)|}{|x - y|^\sigma},$$

Let  $s > 0$  and  $s = \lfloor s \rfloor + \{s\}$  with  $\lfloor s \rfloor \in \mathbb{Z}$  and  $\{s\} \in (0, 1]$ . Then the Hölder space with index  $s$  is given by

$$\mathcal{C}^s = \left\{ f \in \mathcal{C}^{\lfloor s \rfloor} : \|f|C^s\| := \|f|C^{\lfloor s \rfloor}\| + \sum_{|\alpha|=\lfloor s \rfloor} \|D^\alpha f|lip^{\{s\}}\| < \infty \right\}.$$

It holds

$$f, g \in \mathcal{C}^s \Rightarrow f \cdot g \in \mathcal{C}^s \text{ and } \|f \cdot g|C^s\| \leq c_s \|f|C^s\| \cdot \|g|C^s\|,$$

and

$$(\forall f \in \mathcal{C}^s : f \cdot g \in \mathcal{C}^s) \Rightarrow g \in \mathcal{C}^s \text{ and } \|P_g : \mathcal{C}^s \rightarrow \mathcal{C}^s\| \geq \|g|C^s\|$$

Proof: Leibniz rule for Hölder spaces and  $1 \in \mathcal{C}^s$ .

# The Lebesgue spaces $L_p$

Let  $0 < p \leq \infty$  and  $L_p$  the usual set of equivalence classes of measurable functions  $f$  with finite

$$\|f\|_{L_p} := \begin{cases} \left( \int_{\mathbb{R}^n} |f(x)|^p dx \right)^{\frac{1}{p}} & , 0 < p < \infty \\ \text{ess sup } |f(x)| & , p = \infty \end{cases}$$

# The Lebesgue spaces $L_p$

Let  $0 < p \leq \infty$  and  $L_p$  the usual set of equivalence classes of measurable functions  $f$  with finite

$$\|f\|_{L_p} := \begin{cases} \left( \int_{\mathbb{R}^n} |f(x)|^p dx \right)^{\frac{1}{p}} & , 0 < p < \infty \\ \text{ess sup } |f(x)| & , p = \infty \end{cases}$$

Then

$$f \in L_p, g \in L_\infty \Rightarrow f \cdot g \in L_p \text{ and } \|f \cdot g\|_{L_p} \leq \|f\|_{L_p} \cdot \|g\|_{L_\infty}$$

and

$$(\forall f \in L_p : f \cdot g \in L_p) \Rightarrow g \in L_\infty \text{ and } \|P_g : L_p \rightarrow L_p\| \geq \|g\|_{L_\infty}$$

# The Sobolev spaces $W_p^k(i)$

Let  $1 < p < \infty$ ,  $k \in \mathbb{N}_0$  and  $W_p^k$  the set of equivalence classes of measurable functions  $f$  with finite

$$\|f\|_{W_p^k} := \sum_{|\alpha| \leq k} \|D^\alpha f(x)\|_{L_p}.$$

# The Sobolev spaces $W_p^k$ (i)

Let  $1 < p < \infty$ ,  $k \in \mathbb{N}_0$  and  $W_p^k$  the set of equivalence classes of measurable functions  $f$  with finite

$$\|f|W_p^k\| := \sum_{|\alpha| \leq k} \|D^\alpha f(x)|L_p\|.$$

Then

$$f \in W_p^k, g \in C^k \Rightarrow f \cdot g \in W_p^k \text{ and } \|f \cdot g|W_p^k\| \leq \|f|W_p^k\| \cdot \|g|C^k\|.$$

The converse is not true!

# The Sobolev spaces $W_p^k$ (ii)

## Theorem (Sobolev embedding)

Let  $k_1 < k_2$  and  $k_1 - \frac{n}{p_1} \leq k_2 - \frac{n}{p_2}$ . Then

$$W_{p_2}^{k_2} \hookrightarrow W_{p_1}^{k_1}.$$

# The Sobolev spaces $W_p^k$ (ii)

## Theorem (Sobolev embedding)

Let  $k_1 < k_2$  and  $k_1 - \frac{n}{p_1} \leq k_2 - \frac{n}{p_2}$ . Then

$$W_{p_2}^{k_2} \hookrightarrow W_{p_1}^{k_1}.$$

## Theorem (Multiplier algebra)

If  $k > \frac{n}{p}$ , then

$$\|f \cdot g\|_{W_p^k} \leq \|f\|_{W_p^k} \cdot \|g\|_{W_p^k}.$$

# The Sobolev spaces $W_p^k$ (ii)

## Theorem (Sobolev embedding)

Let  $k_1 < k_2$  and  $k_1 - \frac{n}{p_1} \leq k_2 - \frac{n}{p_2}$ . Then

$$W_{p_2}^{k_2} \hookrightarrow W_{p_1}^{k_1}.$$

## Theorem (Multiplier algebra)

If  $k > \frac{n}{p}$ , then

$$\|f \cdot g\|_{W_p^k} \leq \|f\|_{W_p^k} \cdot \|g\|_{W_p^k}.$$

Proof: We start with

$$\|D^\alpha(f \cdot g)\|_{L_p} \leq c \sum \|(D^\beta f) \cdot (D^{\alpha-\beta} g)\|_{L_p}$$

# The Sobolev spaces $W_p^k$ (iii)

$$\begin{aligned}\|D^\alpha(f \cdot g)|_{L_p}\| &\leq c \sum \| (D^\beta f) \cdot (D^{\alpha-\beta} g) \|_{L_p} \\ &\leq c \sum \| (D^\beta f) \|_{L_{p_1}} \cdot \| (D^{\alpha-\beta} g) \|_{L_{p_2}} \\ &\leq c \sum \| f \|_{W_{p_1}^{|\beta|}} \cdot \| g \|_{W_{p_2}^{|\alpha|-|\beta|}} \\ &\leq c' \| f \|_{W_p^k} \cdot \| g \|_{W_p^k}.\end{aligned}$$

# The Sobolev spaces $W_p^k$ (iii)

$$\begin{aligned}
 \|D^\alpha(f \cdot g)\|_{L_p} &\leq c \sum \| (D^\beta f) \cdot (D^{\alpha-\beta} g) \|_{L_p} \\
 &\leq c \sum \| (D^\beta f) \|_{L_{p_1}} \cdot \| (D^{\alpha-\beta} g) \|_{L_{p_2}} \\
 &\leq c \sum \| f \|_{W_{p_1}^{|\beta|}} \cdot \| g \|_{W_{p_2}^{|\alpha|-|\beta|}} \\
 &\leq c' \| f \|_{W_p^k} \cdot \| g \|_{W_p^k}.
 \end{aligned}$$

Here ( $|\alpha| \leq k$ )

$$\begin{aligned}
 \frac{1}{p_1} + \frac{1}{p_2} &= \frac{1}{p} \\
 |\beta| - \frac{n}{p_1} &\leq k - \frac{n}{p} \\
 |\alpha| - |\beta| - \frac{n}{p_2} &\leq k - \frac{n}{p}
 \end{aligned}$$

This is possible, if  $k > \frac{n}{p}$ .

# The Sobolev spaces $W_p^k$ (iv)

Theorem (see e.g Runst and Sickel 1996)

*The spaces  $W_p^k \cap L_\infty$  are multiplier algebras, even*

$$\|f \cdot g\|_{W_p^k} \leq c \left( \|f\|_{W_p^k} \cdot \|g\|_{L_\infty} + \|g\|_{W_p^k} \cdot \|f\|_{L_\infty} \right)$$

# The Sobolev spaces $W_p^k$ (iv)

Theorem (see e.g. Runst and Sickel 1996)

*The spaces  $W_p^k \cap L_\infty$  are multiplier algebras, even*

$$\|f \cdot g|_{W_p^k}\| \leq c \left( \|f|_{W_p^k}\| \cdot \|g|_{L_\infty}\| + \|g|_{W_p^k}\| \cdot \|f|_{L_\infty}\| \right)$$

Theorem (see e.g. Triebel 2008)

*If  $W_p^k$  is a multiplier algebra, then  $\varphi$  is a pointwise multiplier for  $W_p^k$  iff*

$$\sup_{m \in \mathbb{Z}} \|\psi(\cdot - m) \cdot \varphi|_{W_p^k}\| < \infty,$$

*where  $\psi$  is a nonnegative  $C_0^\infty$ -function with*

$$\sum_m \psi(x - m) = 1 \text{ for } x \in \mathbb{R}^n.$$

# Resolution of unity

Let  $\varphi_0 \in \mathcal{S}(\mathbb{R}^n)$  such that  $\text{supp } \varphi_0 \subset \{|x| \leq \frac{3}{2}\}$  and  $\varphi_0(x) = 1$  for  $|x| \leq 1$ . We define

$$\varphi(x) := \varphi_0(x) - \varphi_0(2x) \text{ and } \varphi_j(x) := \varphi(2^{-j}x) \text{ for } j \in \mathbb{N}.$$

# Resolution of unity

Let  $\varphi_0 \in \mathcal{S}(\mathbb{R}^n)$  such that  $\text{supp } \varphi_0 \subset \{|x| \leq \frac{3}{2}\}$  and  $\varphi_0(x) = 1$  for  $|x| \leq 1$ . We define

$$\varphi(x) := \varphi_0(x) - \varphi_0(2x) \text{ and } \varphi_j(x) := \varphi(2^{-j}x) \text{ for } j \in \mathbb{N}.$$

Then we have

$$\begin{aligned} \sum_{j=0}^{\infty} \varphi_j(x) &= 1. \\ |D^\alpha \varphi_j(x)| &\leq c_\alpha 2^{-j|\alpha|}, \\ \text{supp } \varphi_j &\subset \{2^{j-1} \leq |x| \leq 2^{j+1}\}, \end{aligned} \tag{1}$$

A sequence of functions  $\{\varphi_j\}_{j=0}^{\infty}$  with (1),  $\varphi_j \in \mathcal{S}(\mathbb{R}^n)$  and  $\varphi_0$  as above will be called resolution of unity.

# The definition of $B_{p,q}^s(\mathbb{R}^n)$

Let  $\{\varphi_j\}_{j=0}^\infty$  be a resolution of unity. Let  $0 < p \leq \infty$ ,  $0 < q \leq \infty$  and  $s \in \mathbb{R}$ . For  $f \in \mathcal{S}'(\mathbb{R}^n)$  we define

$$\|f|B_{p,q}^s(\mathbb{R}^n)\|^\varphi := \left( \sum_{j=0}^{\infty} 2^{jsq} \|(\varphi_j \hat{f})^\vee\|_{L_p}^q \right)^{\frac{1}{q}}$$

(modified in case  $q = \infty$ ) and

$$B_{p,q}^{s,\varphi}(\mathbb{R}^n) := \{f \in \mathcal{S}'(\mathbb{R}^n) : \|f|B_{p,q}^s(\mathbb{R}^n)\|^\varphi < \infty\}.$$

Then  $(B_{p,q}^{s,\varphi}(\mathbb{R}^n), \|\cdot|B_{p,q}^s(\mathbb{R}^n)\|^\varphi)$  is a quasi-Banach space. It does not depend on the choice of the resolution of unity  $\{\varphi_j\}_{j=0}^\infty$  in the sense of equivalent norms. So we denote it shortly by  $B_{p,q}^s(\mathbb{R}^n)$ .

# The definition of $F_{p,q}^s(\mathbb{R}^n)$

Let  $\{\varphi_j\}_{j=0}^\infty$  be a resolution of unity. Let  $0 < p < \infty$ ,  $0 < q \leq \infty$  and  $s \in \mathbb{R}$ . For  $f \in \mathcal{S}'(\mathbb{R}^n)$  we define

$$\|f\|_{F_{p,q}^s(\mathbb{R}^n)}^\varphi := \left\| \left( \sum_{j=0}^{\infty} 2^{jsq} |(\varphi_j \hat{f})^\vee|^q \right)^{\frac{1}{q}} \right\|_{L_p}$$

(modified in case  $q = \infty$ ) and

$$F_{p,q}^{s,\varphi}(\mathbb{R}^n) := \{f \in \mathcal{S}'(\mathbb{R}^n) : \|f\|_{F_{p,q}^s(\mathbb{R}^n)}^\varphi < \infty\}.$$

Then  $(F_{p,q}^{s,\varphi}(\mathbb{R}^n), \|\cdot\|_{F_{p,q}^s(\mathbb{R}^n)}^\varphi)$  is a quasi-Banach space. It does not depend on the choice of the resolution of unity  $\{\varphi_j\}_{j=0}^\infty$  in the sense of equivalent norms. So we denote it shortly by  $F_{p,q}^s(\mathbb{R}^n)$ .

Atomic characterization of  $B_{p,q}^s(\mathbb{R}^n)$ 

## Theorem

Let  $0 < p \leq \infty$ ,  $0 < q \leq \infty$  and  $s \in \mathbb{R}$ . Let  $K, L \geq 0$ ,  $K > s$  and  $L > \sigma_p - s$ . Then  $f \in \mathcal{S}'(\mathbb{R}^n)$  belongs to  $B_{p,q}^s(\mathbb{R}^n)$  if and only if it can be represented as

$$f = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot a_{\nu,m} \quad \text{with convergence in } \mathcal{S}'(\mathbb{R}^n).$$

Here  $a_{\nu,m}$  are  $(s, p)_{K,L}$ -atoms located at  $Q_{\nu,m}$  and  $\|\lambda|b_{p,q}\| < \infty$ . Furthermore, we have in the sense of equivalence of norms

$$\|f|B_{p,q}^s(\mathbb{R}^n)\| \sim \inf \|\lambda|b_{p,q}\|,$$

where the infimum on the right-hand side is taken over all admissible representations of  $f$ .

Atomic characterization of  $F_{p,q}^s(\mathbb{R}^n)$ 

## Theorem

Let  $0 < p < \infty$ ,  $0 < q \leq \infty$  and  $s \in \mathbb{R}$ . Let  $K, L \geq 0$ ,  $K > s$  and  $L > \sigma_{p,q} - s$ . Then  $f \in \mathcal{S}'(\mathbb{R}^n)$  belongs to  $F_{p,q}^s(\mathbb{R}^n)$  if and only if it can be represented as

$$f = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot a_{\nu,m} \quad \text{with convergence in } \mathcal{S}'(\mathbb{R}^n).$$

Here  $a_{\nu,m}$  are  $(s, p)_{K,L}$ -atoms located at  $Q_{\nu,m}$  and  $\|\lambda|f_{p,q}\| < \infty$ . Furthermore, we have in the sense of equivalence of norms

$$\|f|F_{p,q}^s(\mathbb{R}^n)\| \sim \inf \|\lambda|f_{p,q}\|,$$

where the infimum on the right-hand side is taken over all admissible representations of  $f$ .

# Treatment of products using atomic decompositions

$$f \in A_{p,q}^s(\mathbb{R}^n)$$

If  $\varphi \cdot a_{\nu,m}$  are atoms:  $\varphi \cdot f \in A_{p,q}^s(\mathbb{R}^n)$

# The definition of atoms

A function  $a : \mathbb{R}^n \rightarrow \mathbb{R}$  is called classical  $(s, p)_{K,L}$ -atom located at  $Q_{\nu,m}$  if

$$\text{supp } a \subset d \cdot Q_{\nu,m}$$

$$|D^\alpha a(x)| \leq C \cdot 2^{-\nu \left(s - \frac{n}{p}\right) + |\alpha|\nu} \text{ for all } |\alpha| < K + 1, \quad (2)$$

$$\int_{\mathbb{R}^n} x^\beta a(x) dx = 0 \text{ for all } |\beta| < L. \quad (3)$$

# The definition of atoms

A function  $a : \mathbb{R}^n \rightarrow \mathbb{R}$  is called classical  $(s, p)_{K,L}$ -atom located at  $Q_{\nu,m}$  if

$$\text{supp } a \subset d \cdot Q_{\nu,m}$$

$$|D^\alpha a(x)| \leq C \cdot 2^{-\nu(s - \frac{n}{p}) + |\alpha|\nu} \text{ for all } |\alpha| < K + 1, \quad (2)$$

$$\int_{\mathbb{R}^n} x^\beta a(x) dx = 0 \text{ for all } |\beta| < L. \quad (3)$$

A function  $a : \mathbb{R}^n \rightarrow \mathbb{R}$  is called  $(s, p)_{K,L}$ -atom located at  $Q_{\nu,m}$  if instead of (2) and (3) it holds (for all  $\psi \in \mathcal{C}^L$ )

$$\|a(2^{-\nu} \cdot) | \mathcal{C}^K \| \leq C \cdot 2^{-\nu(s - \frac{n}{p})}$$

$$\left| \int_{d \cdot Q_{\nu,m}} \psi(x) a(x) dx \right| \leq C \cdot 2^{-\nu(s + L + n(1 - \frac{1}{p}))} \|\psi\|_{\mathcal{C}^L}$$

## Atomic representations revisited

Every classical  $(s, p)_{K,L}$ -atom is an  $(s, p)_{K,L}$ -atom.

## Theorem

*The atomic representation theorem for  $B_{p,q}^s(\mathbb{R}^n)$  and  $F_{p,q}^s(\mathbb{R}^n)$  is valid with both forms of atoms. Hence every  $f$  which can be represented as a linear combination of classical  $(s, p)_{K,L}$ -atom resp.  $(s, p)_{K,L}$ -atom belongs to  $B_{p,q}^s(\mathbb{R}^n)$  resp.  $F_{p,q}^s(\mathbb{R}^n)$ . Hereby*

$$K > s \quad \text{and}$$

$$L > \sigma_p - s = \sigma_p = n \left( \frac{1}{p} - 1 \right)_+ - s \quad \text{resp.}$$

$$L > \sigma_{p,q} - s = n \left( \frac{1}{\min(p, q)} - 1 \right)_+ - s$$

## Atomic representations revisited

Every classical  $(s, p)_{K,L}$ -atom is an  $(s, p)_{K,L}$ -atom.

## Theorem

*The atomic representation theorem for  $B_{p,q}^s(\mathbb{R}^n)$  and  $F_{p,q}^s(\mathbb{R}^n)$  is valid with both forms of atoms. Hence every  $f$  which can be represented as a linear combination of classical  $(s, p)_{K,L}$ -atom resp.  $(s, p)_{K,L}$ -atom belongs to  $B_{p,q}^s(\mathbb{R}^n)$  resp.  $F_{p,q}^s(\mathbb{R}^n)$ . Hereby*

$$K > s \quad \text{and}$$

$$L > \sigma_p - s = \sigma_p = n \left( \frac{1}{p} - 1 \right)_+ - s \quad \text{resp.}$$

$$L > \sigma_{p,q} - s = n \left( \frac{1}{\min(p, q)} - 1 \right)_+ - s$$

The proof for classical atoms goes back to Triebel '97. The modifications were suggested by Skrzypczak '98, Triebel/Winkelvoss '96.

# The pointwise multiplier theorem (i)

Now we get

## Lemma

*There exists a constant  $c$  with the following property: For all  $\nu \in \mathbb{N}_0$ ,  $m \in \mathbb{Z}$ , all  $(s, p)_{K,L}$ -atoms  $a_{\nu,m}$  with support in  $d \cdot Q_{\nu,m}$  and all  $\varphi \in C^p$  with  $\rho \geq \max(K, L)$  the product*

$$c \cdot \|\varphi\|_{C^p}^{-1} \cdot \varphi \cdot a_{\nu,m}$$

*is an  $(s, p)_{K,L}$ -atom with support in  $d \cdot Q_{\nu,m}$ .*

# The pointwise multiplier theorem (i)

Now we get

## Lemma

*There exists a constant  $c$  with the following property: For all  $\nu \in \mathbb{N}_0$ ,  $m \in \mathbb{Z}$ , all  $(s, p)_{K,L}$ -atoms  $a_{\nu,m}$  with support in  $d \cdot Q_{\nu,m}$  and all  $\varphi \in C^\rho$  with  $\rho \geq \max(K, L)$  the product*

$$c \cdot \|\varphi\|_{C^\rho}^{-1} \cdot \varphi \cdot a_{\nu,m}$$

*is an  $(s, p)_{K,L}$ -atom with support in  $d \cdot Q_{\nu,m}$ .*

Proof: Use that  $C^\rho$  is a multiplication algebra.

This does not work for classical atoms  $(s, p)_{K,L}$ -atoms with  $L \geq 1$ , since in general moment conditions are destroyed when multiplying by  $\varphi$ !

# The pointwise multiplier theorem (ii)

We get as a Corollary

## Theorem

Let  $s \in \mathbb{R}$  and  $0 < q \leq \infty$ .

(i) Let  $0 < p \leq \infty$  and  $\rho > \max(s, \sigma_p - s)$ . Then there exists a positive number  $c$  such that

$$\|\varphi f|B_{p,q}^s(\mathbb{R}^n)\| \leq c \|\varphi|C^{\rho}\| \cdot \|f|B_{p,q}^s(\mathbb{R}^n)\|$$

for all  $\varphi \in C^{\rho}$  and all  $f \in B_{p,q}^s(\mathbb{R}^n)$ .

(ii) Let  $0 < p < \infty$  and  $\rho > \max(s, \sigma_{p,q} - s)$ . Then there exists a positive number  $c$  such that

$$\|\varphi f|F_{p,q}^s(\mathbb{R}^n)\| \leq c \|\varphi|C^{\rho}\| \cdot \|f|F_{p,q}^s(\mathbb{R}^n)\|$$

for all  $\varphi \in C^{\rho}$  and all  $f \in F_{p,q}^s(\mathbb{R}^n)$ .

# The diffeomorphism theorem (i)

In the same way we can treat the mapping  $D_\varphi$ :

$$f = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot a_{\nu,m} \Rightarrow f \circ \varphi = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot (a_{\nu,m} \circ \varphi).$$

# The diffeomorphism theorem (i)

In the same way we can treat the mapping  $D_\varphi$ :

$$f = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot a_{\nu,m} \Rightarrow f \circ \varphi = \sum_{\nu=0}^{\infty} \sum_{m \in \mathbb{Z}^n} \lambda_{\nu,m} \cdot (a_{\nu,m} \circ \varphi).$$

Hence we have to investigate if  $a_{\nu,m} \circ \varphi$  is an  $(s, p)_{K,L}$ -atom when  $a_{\nu,m}$  is an  $(s, p)_{K,L}$ -atom.

# The diffeomorphism theorem (ii)

## Definition

Let  $\rho \geq 1$ .

(i) Let  $\rho = 1$ . We say that the map  $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}^n$  is a 1-diffeomorphism if  $\varphi$  is a bi-Lipschitzian map, i.e. that there are constants  $c_1, c_2 > 0$  such that

$$c_1 \leq \frac{|\varphi(x) - \varphi(y)|}{|x - y|} \leq c_2.$$

for all  $x, y \in \mathbb{R}^n$  with  $0 < |x - y| \leq 1$ .

(ii) Let  $\rho > 1$ . We say that the one-to-one map  $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}^n$  is a  $\rho$ -diffeomorphism if the  $n$  components  $\varphi_i$  of  $\varphi$  have classical derivatives up to order  $[\rho]$  with  $\frac{\partial \varphi_i}{\partial x_j} \in \mathcal{C}^{\rho-1}$  and  $|\det J(\varphi)(x)| \geq c > 0$  for all  $x \in \mathbb{R}^n$ .

# The diffeomorphism theorem (iii)

## Theorem

(i) Let  $0 < p \leq \infty$ ,  $\rho \geq 1$  and  $\rho > \max(s, 1 + \sigma_p - s)$ . If  $\varphi$  is a  $\rho$ -diffeomorphism, then there exists a constant  $c$  such that

$$\|f(\varphi(\cdot))\|_{B_{p,q}^s(\mathbb{R}^n)} \leq c \|f\|_{B_{p,q}^s(\mathbb{R}^n)}$$

for all  $f \in B_{p,q}^s(\mathbb{R}^n)$ . Hence  $D_\varphi$  maps  $B_{p,q}^s(\mathbb{R}^n)$  onto  $B_{p,q}^s(\mathbb{R}^n)$ .

(ii) Let  $0 < p < \infty$ ,  $\rho \geq 1$  and  $\rho > \max(s, 1 + \sigma_{p,q} - s)$ . If  $\varphi$  is a  $\rho$ -diffeomorphism, then there exists a constant  $c$  such that

$$\|f(\varphi(\cdot))\|_{F_{p,q}^s(\mathbb{R}^n)} \leq c \|f\|_{F_{p,q}^s(\mathbb{R}^n)}$$

for all  $f \in F_{p,q}^s(\mathbb{R}^n)$ . Hence  $D_\varphi$  maps  $F_{p,q}^s(\mathbb{R}^n)$  onto  $F_{p,q}^s(\mathbb{R}^n)$ .
